The present invention relates to a new polynucleotide having small inducible cytokine subfamily B (Cys-X-Cys), Member 6 (granulocyte chemotractic protein 2) (SCYB6) isogene. The invention is useful for studying expression and function of SCYB6 and expressing SCYB6 protein for use in screening for candidate drugs to treat diseases related to SCYB6 activity. The polymorphism and haplotype data is useful for validating whether SCYB6 is a suitable target for drugs to inflammatory disorders and cancer, screening for such drugs and reducing bias in chinical trials of such drugs. The invention is also useful for therapeutic purposes. The method of the invention is useful for the abenutic purposes. The method of the invention is useful for identifying an association between susceptibility to a disease, staging of a disease, or response to a drug. The present nucleic acid sequence represents one of a collection of oligonucleotide primers (ABK85680-CCC) that were used in the invention to detect polymorphisms in the human SCYB6 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polymorphic variant of small inducible cytokine subfamily B (Cys-X-Cys), Member 6 (granulocyte chemotactic protein 2) gene, useful for expressing protein isoform used in drug screening techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                   888888888
                                                                                                                                                                                                    ò
                                                                                                                                                                                                                     g
                                                                                                                                          The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/activation DC. Also described are: (1) a protein expressed by the above human maturation/activation C expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL42247 represent specifically claimed human maturation/activation DC expression gene tags from the present invention.
                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the

The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL42627 to ABL4296 represent specifically claimed human maturation/activation DC expression gene tags from the present invention.
highest expression among the genes expressed in human maturation/
activation DC. Also described are: (1) a protein expressed by the above
human maturation/activation DC expression gene; (2) an antibody against
the protein; and (3) an antegonist against the expression of each gene
belonging to the above gene group. The gene group is useful for the
treatment and the diagnosis of various human diseases related to human
DC. ABL42637 to ABL42026 repressnt specifically claimed human
maturation/activation DC expression gene tags from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (FI), a second (F2), and a third (F3) a target site comprises, in 3'-5' direction, a first (SI), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) encomprising (I); (2) a polyfuciectide (III) encoding (I) or (III); and (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that binds to a target site. (I) is useful for recognition of triplet carget subsites having the nucleotide G in the 5'-most position of the subsites having the nucleotide G in the 5'-most position of the subsites and plant engineering (I), (II) or (III) is useful in therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid in a sample, and in assays to determined the phonotype and function of gene expression. (I) has improved affinity and specificity for their target sequences, as well as enhanced continued the companies of the sequences and zinc finger peptides which are given the procession of the present DNA target sequences and zinc finger peptides which are given the procession of the procession o

The present invention describes a zinc finger protein (1) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) zinc finger, ordered F1, F2, F3 from W-terminus to C-terminus, where the target site comprises, in 3-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (1) a polypeptide (II) comprising (I); (2) a polynuclectide (III) encoding (I) or (II); and (3) designing (M) (I) involves selecting the F1 zinc finger such that it binds to the S1 target subsite, and selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F2 zinc finger such that binds to the S2 target subsite, thus designing (I) that binds to the S2 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites having the nucleotide G in the 5'-most position of the subsite. (I) is useful in studying gene function, and for human the subject, in diagnostic methods for sequence specific detection of the a subject, in diagnostic methods for sequence specific detection of the carget nucleic acid in a sample, and in assays to determined the subject in diagnostic methods for sequence specific detection of the carget nucleic acid in a sample, and in assays to determined the biological activity. ABQ71213 to ABQ72214 and ABD48191 to ABD51230 the sevent DNA target sequences, as well as enhanced to the carget sequences and zinc finger peptides which are given the backet of the process the function of the process and since function of the process and since function of the precession the function of the process and since function of the gi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                                                                                                                                                                                                                                                                                                                                                                                                             protein related oligonucleotide target SEQ ID NO:1275.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Zinc finger protein; ZFP; DNA binding protein; zinc finger; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   in the exemplification of the present invention.

                                                                                                                                                         g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a zinc finger protein (I) that binds to
a target site, comprising a first (FI), a second (F2), and a third (F3)

c zinc finger, ordered FI, F2, F3 from N-terminus to C-terminus, where the
target site comprises, in 3'-5' direction, a first (SI), a second (S2),

c target site comprises, in 3'-5' direction, a first (SI), a second (S2),

c (II) comprising (I); (2) a polynuclectibed are: (1) a polypeptide

CC (II) comprising (I); (2) a polynuclectide (III) encoding (I) or (III); and

CC (II) comprising (I); (2) a polynuclecting the F1 zinc finger such that

CC (II) comprising (I); (1) involves selecting the F2 zinc finger such

CC (III) thinds to the S1 target subsite, and selecting the F3 zinc

CI that it binds to the S2 target subsite, thus designing (I)

CC finger such that it binds to the S3 target subsite, thus designing (I)

CL that binds to a target site. (I) is useful for recognition of triplet

CR subsite. (I) is useful in studying gene function, and for human

CC subsite. (I) is useful in studying gene function, and for human

CC therapeutic methods to modulate the expression of a target region within

CR subject, in diagnostic methods for sequence specific detection of

CA subject, in diagnostic methods for sequence specific detection of

CA subject, in diagnostic methods for sequence specific detection of

CA and specificity for their target sequences, as well as enhanced

CA and specificity for their target sequences, as well as enhanced

CA biological activity. ABQ71213 to ABQ7214 and ABP48191 to ABP51230

CA in the exemplification of the present invention.
                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New zinc finger protein that binds to target site, useful in studying gene function and for human therapeutics and plant engineering, comprises first, second and third zinc fingers, ordered from N- to
                                                                       Gaps
                                                                                                                                                                                                                                                                                                                   related oligonucleotide target SEQ ID NO:1337.
                                                                                                                                                                                                                                                                                                                                              Zinc finger protein; ZFP; DNA binding protein; zinc finger; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This invention describes a novel method for sequencing an unknown DNA molecule which comprises selecting a library primer from an octamer oligonous clothed library consisting of 48 8-bp sequences and corresponding complementary sequences, where the library primer is complementary to a known sequence adjacent to the unknown sequence or is complementary to a sequence in a known extension product. The method is useful for DNA nucleotide sequencing, in PCR, and in other processes which make use of primers. The octamers are used to identify coding sequences. Primer walking using the octamer libraries is advantageous over other sequencing methods because it does not require multiple cloning steps nor subsequent template preparations, and it is a directed and methodical approach. AAA80688-A81253 represent the octamer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequencing an unknown DNA molecule for the polymerase chain reaction and other primer processes comprises primer walking of octamer oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to novel genetic variants of human tumnour necrosis factor (INF) alpha genes. The polymorphic variants are useful in studying the expression and function of INF, in expressing INF proteil for use in screening for candidate durgs to treat diseases related to TNN activity. The pharmaceutical compositions comprising TNF polynucleotide, an antisease oligonucleotide directed against one of the novel TNF isogenes, a polynucleotide directed against one of the novel TNF another compound that inhibits expression of the TNF isogene are useful for treating disorders affected by expression of the TNF isogene are useful for treating disorders affected by expression of stanction of the TNF isogene e.g. cancer, diabetes or inflammantary disorders. Sequences of the invention are also used in gene therapy. The present DNA sequence is a primer used to detect human TNF alpha gene polymorphisms.
                                                                                                                                                                                                                                               Human; tumour necrosis factor; TNF alpha; cancer; inflammatory disorder;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New genetic variants comprising human Tumor Necrosis Factor alpha (TNF) isogene, useful for studying the expression and function of TNF and in screening for drugs to treat cancer, diabetes or inflammatory disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising administering a NORF gene expression tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at chase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a carpression varies as in M., where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M2) for identifying human genes which are involved in cell cycle capression comprising contacting human DNA with a probe which comprises of Least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell of at least 1 contiguous monitoring expression in the yeast cell of recondidate drug and monitoring expression in the yeast cell of recondidate drug and monitoring expression in the yeast cell of recondidate drug and monitoring expression in the yeast cell of recondidate drug and monitoring expression in the yeast cell of recondidate cell cycle. The methods may be used as markers of phases of the cell cycle. The methods may be used as markers of phases of the cell cycle. The methods may be used to identification of antifungal drugs. The NORF cell content of a cell cycle and for identification of antifungal drugs. The NORE cell cycle the cell cycle and for identification of antifungal drugs. The NORE cell cycle recent invested to the relation of antifungal drugs. The NORE cell cycle and for identification of antifungal drugs. The NORE cell cycle whose week as an the co

                                                                                                                                                                                                                                                               à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell CYCle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a year cell; and (b) monitoring expression of a NORF gene whose cypression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle expression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a candidate drug and monitoring expression in the yeast cell of at least 1 comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 1 conce man; he was a criefort of drugs. The NORF conce man; he was a condidate of a class of drugs and monitoring expression in the yeast cell of at least 1 conce man; he was not a class of concerned by the class of drugs. The NORF concerned the concerned concerned to the concerned concerned to the concerned concerned to the class of concerned to the class of concerned to the concerned to the concerned concerned to the concern
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAF33268 to AAF44064 represent SAGE tags used in the exemplification of the present invention. AAF33267 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonanotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contracting a test substance with a cyast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression varies as in M1, where a test substance which modifies the cypression varies as in M1, where a test substance which modifies the cypression varies generally human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises the least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a
                                                                                                                                                                                                                                                                 ö

candidate drug and monitoring expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAR33208 to AAR44064 represent SAGE tags used in the exemplification of the present invention. AAR33262 to AAR33207 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (MI) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a

expression varies as in MJ, where a test substance which modifies the expression varies as in MJ, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in MJ; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a yeast cell comprising contacting a yeast cell with a candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell of at least NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to study, monitor and affect phases of the cell cycle, the cell cycle and for identification of antifungal drugs.

AAF33268 to AAF44064 represent SAGE to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifugal drugs comprising; (a) contacting a test substance with a cyeast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression varies as in M1, where a test substance which modifies the corpression comprising contacting human DNA with a probe which comprises of the yeast gene is a candidate drug as a member of a class of drugs having a characteristic effect on gene member of a class of drugs having a characteristic effect on gene contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF condidate drug and monitoring expression in the yeast cell of at least 10 NORF gene whose expression is affected by the class of drugs. The NORF condidate drug and monitoring expression in the yeast cell of at least 10 condidate and for identifying a sarkers of phases of the cell cycle. The methods may be used a markers of phases of the cell cycle. The methods may be used as markers of phases of the cell cycle. The methods may be used in the exemplification of the present invention. AAP33262 to administration of the present linkers and por identify represent linkers and por identification of the present invention. AAP33262 to a primers used in the SAGE method, in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate a antifungal drugs comprising; (a) contacting a test substance with a cyeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies of a class of drugs having a characteristic effect on gene contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF candidate drug and monitoring expression in the yeast cell of at least NORF gene whose expression is affected by the class of drugs. The NORF candidate drug and monitoring expression in the yeast cell of at least to work genes way be used to identify candidate drugs which affect the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. AAR33268 to AAR33267 represent linvention. The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ŏ
                                                                                                                                                                                                                                                                                                                        The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a cycast cell; and (b) monitoring expression of a NORF gene whose expression varies as in M1, where a test substance which modifies the expression varies as in M1, where a test substance which modifies the cypression comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene member of a class of drugs having a characteristic effect on gene candidate drug and monitoring expression in the yeast cell with a candidate drug and monitoring expression in the yeast cell of at least 10 NORF gene whose expression is affected by the class of drugs. The NORF comparison is affected by the class of drugs which candidate drug and monitoring expression in the yeast cell of at least 10 candidate and for identifying a candidate drugs which cafferentially expressed genes may be used to identify candidate drugs which the cell cycle. The methods may be used to identify and drugs. CAAF33268 to AAF43268 to identify and each of identifying a characteristic of the present invention. The sequences given in AAQ65549-60 are spacer elements used within the insertion elements of the invention. These insertion elements contain junk DNA, two spacer elements, a functional DNA sequence and a primer binding site. They also contain an MluI site, an MluI site, an MluI site is and a NheI site. The junk DNA serves to keep the MluI site if rom being at the extreme end of the molecule and also allows determination that the MluI cleavage has occured because the extended DNA will be reduced in size by the length of the junk sequence and the junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The junk sequence will appear as a reaction product. The primer is available or the amplifiable nucleic acid. The primer binding site can be synthesised. However, the primer and primer binding site are chosen such that the primer itself does not brind to any other portion of the insertion element under construction. The bind to any other portion of the insertion element micronial molecule into a host molecule to form a recombinant molecule. The spacer elements are thought to relieve structural stresses imposed on the host by addition of the functional nucleotide sequence. The host be used with nucleic acid hybridisation assays. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Sequences AA277573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while or ther transcripts correspond to novel genes. Antigen-presenting cell cativation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone instituted to activate a robust cytotoxic T-lymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses. They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in an APC; and as hybridisation probes/amplification primers for the dagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, con the used to identify cells as belonging to the monocyte lineage. Cells containing these genes can be used in active immunotherapy (or to stimulate)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Isolated polynucleotides differentially expressed in antigen-presenting cells, useful in gene vaccines against cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 1; Page 80; 130pp; English.

vectors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for recruitment of immune effector cells.

for efficient activation of cytotoxic T-1ymphocytes (CTLS). Nucleic acid sequences identified using the SAGE tags have several potential uses.

Cr frey may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in Cf agents hybridisation probes/amplification primers for the chaptersion of these genes. Detection of the dendritic cell differentially expressed genes, or of their emoded proteins, can be used of inferentially expressed genes, or of their emoded proteins, can be used to identify cells as belonging to the monocyte lineage. Cells containing them are used in active immunotherapy (or to stimulate production of a population of antiger specific effector cells) and cortors containing them are used in gene therapy. Co-administration of tumour antigens and APC-associated costimulatory factors ensures adequate containing presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of T cell growth factors and secretion of chemokines for
                                                                                                                                                                                                                                                                                                                                                                        sequences AA277573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially on differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell (APC)-associated osstimulatory factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can insufficient complex in mannostimulatory cofactors also being required
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Sequences AAZ77573-279709 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts encoding immunostimulatory cofactor proteins which are preferentially or differentially expressed in monocyte-derived dendritic cells compared with monocytes. Some of the transcripts correspond to known genes or ESTS (expressed sequence tags) which were previously unknown to be preferentially or differentially expressed in dendritic cells, while other transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell cher transcripts correspond to novel genes. Antigen-presenting cell chery factors play an important role in the activation of the cytotoxic immune response, particularly against tumour cells. Tumour antigen presentation via the MHC (major histocompatibility complex) and subsequent recognition by T-cell receptors is alone insufficient to activate a robust cytotoxic immune response that can lyse the tumour cells, immunostimulatory cofactors also being required for efficient activation of cytotoxic T-lymphocytes (CTLS). sequences identified using the SAGE tags have several potential uses.
They may be used in vaccines to induce an immune response, particularly against a tumour antigen; to modulate the genotype of an APC; to screen for agents that modulate expression of differentially expressed genes in APC; and as hybridisation probes/amplification primers for the diagnosis, prognosis and monitoring of diseases related to abnormal expression of these genes. Detection of the dendritic cell differentially expressed genes, or of their encoded proteins, can be used to identify cells as belonging to the monocyte lineage cells containing these genes can be used in active immunotherapy (or to stimulate production of a population of antigen-specific effector cells) and the production of a population of antigen-specific effector cells) and cumour antigens and APC associated costimulatory factors ensures adequate antigen presentation to endogenous APCs and upregulates the APCs for the presentation of co-stimulatory signals, migration to T cell-rich sites, secretion of I cell growth factors and secretion of chemokines for recruitment of immune effector cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer -

                               transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts that are upreferentially transcribed in metastatic breast transcribts.

AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen encoded by the transcripts are also consist antibodies. The area of the properties are also consist antibodies.
                                                                                                                                                                                                                                   specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for

transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

Ax28342 to Ax286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ó

                                                                                                                                                                                                                                  transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AAX83942 to AAX86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells).

AAX83942 to AAX86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense cell types, of e.g. therapeutic genes (also ribozymes or antisense cell types, of e.g. therapeutic genes (also ribozymes or antisense cell based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising therapeutic agents. Host cells that produce the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune

transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts.

AA283942 to AA286677 represent tags corresponding to distinct transcripts.

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour calls). These transcripts can be used for diagnosis, prognosis, call you set transcripts are downregulated in metastatic breast tumour calls). These transcripts are conjugated in metastatic breast tumour calls). These transcripts are predictions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense cell. types, of e.g. therapeutic genes (also ribozymes or antisense cell. based vaccines, Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising therapeutic agents. Host cells that produce the polypeptides on as therapeutic calls, e.g. cytotoxic I lymphocytes, and these used for antisense contents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; metastatic breast tumour tissue; breast cancer; tag; primer;

                                                                                                                                                                                                                                                                                                                                                                                       AA280767 to AA283941 represent tags corresponding to distinct
transcripts that are preferentially transcribed in the metastatic breast
tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AA283942 to AA286677 represent tags corresponding to distinct transcripts
that are preferentially transcribed in the primary or non-metastatic
transcripts can be used for diagnosis, prognosis,
cells). These transcripts can be used for diagnosis, prognosis,
monitoring and treatment of breast cancer, particularly where metastatic.
Diagnosis is by standard immunoassays or hybridisation/amplification
reactions. Compounds that modulate expression of the transcripts are
promoters from the transcripts are used to direct expression, in selected
cell types, of e.g. therapeutic genes (also ribozymes or antisense
cell types, of e.g. therapeutic genes (also ribozymes or antisense
cell-based vaccines; for diagnosing breast cancer and for raising
specific antibodies (Ab). Ab are used to detect the polypeptides or as
therapeutic agents. Host cells that produce the polypeptides can be used
to expand and isolate populations of educated, antigen-specific immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcribts. It is that are upregulated in metastatic breast transcripts.

AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, contioning and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines; for diagnosing breast cancer and for raising concerts and the concert and for raising concerts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic I lymphocytes, and these used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The transcribed in metastatic breast transcripts.

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected sequences), particularly an antigen-encoding sequence for use in gene or cell-based vaccines, for diagnosing breast cancer and for raising useful in vaccines; for diagnosing breast cancer and for raising

transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells).

AA283942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, on its standard immunoassays or hybridisations. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expend and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated polynucleotides differentially expressed between metastatic and non-metastatic breast cancer cells, useful for diagnosis, prevention and treatment of cancer -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              transcripts that are preferentially transcribed in the metastatic breast transcripts that are preferentially transcribed in the metastatic breast transcripts. Transcripts that are upregulated in metastatic breast transcripts.

AAZ83942 to AAZ86677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour tissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or
                                                                                         ;

cell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be use to expand and isolate populations of educated, antiger specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for adoptive immunotherapy.

monitoring and treatment of breast cancer, particularly where metastatic. Diagnosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also ribozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or oell-based vaccines. Polypeptides encoded by the transcripts are also useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for

transcripts that are preferentially transcribed in the metastatic breast tumour tissue (i.e. are upregulated in metastatic breast tumour cells).

AL83942 to AA286677 represent tags corresponding to distinct transcripts that are preferentially transcribed in the primary or non-metastatic breast tumour rissue (i.e. are downregulated in metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, and treatment of breast cancer, particularly where metastatic breast tumour cells). These transcripts can be used for diagnosis, prognosis, and prognosis is by standard immunoassays or hybridisation/amplification reactions. Compounds that modulate expression of the transcripts are potentially useful for treatment of (metastatic) breast cancer, while promoters from the transcripts are used to direct expression, in selected cell types, of e.g. therapeutic genes (also tibozymes or antisense sequences), particularly an antigen-encoding sequence for use in gene or useful in vaccines; for diagnosing breast cancer and for raising specific antibodies (Ab). Ab are used to detect the polypeptides or as therapeutic agents. Host cells that produce the polypeptides can be used to expand and isolate populations of educated, antigen-specific immune effecter cells, e.g. cytotoxic T lymphocytes, and these used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Isolated polynucleotide comprising a related RAS viral (r-ras) oncogene homologue (RRAS) isogene (comprising defined polymorphism) useful for providing haplotype information and drug screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                           This invention relates to genetic variants of the human related RAS viral oncogene RRAS. Ras proteins are a member of a superfamily of small Greases that are involved in the regulation of cell growth. The invention also comprising one or more of the polymorphisms shown.

(RRAS) isogene comprising one or more of the polymorphisms shown.

(RRAS) isogene comprising one or more of the polymorphisms shown.

(RRAS or to treat disorders such as cancer using antisense therapy.

(RRAS or to treat disorders such as cancer using antisense therapy.

(RRAS or to treat disorders such as cancer using antisense therapy.

(RRAS or to treat disorders such as cancer using antisense therapy.

(RRAS or to treat disorders such as cancer using antisense therapy.

(RRAS or to treat disorders such as cancer using antisense therapy.

(RRAS or to treat disorders such as individual. Furthermore, the polymorphic sequence is useful for such biological function of RRAS as well as identifying drugs targeting the protein for the treatment of as identifying drugs targeting the protein for the treatment of as identifying drugs targeting the protein for the treatment of an elacting whether RRAS is a suitable target for drugs to treat cancer, screening for such drugs and reducing pias in clinical trials.

(RRAS or variant and protein the human related RAS viral oncogene (RRAS)

(RRAS or variant and protein to using the primer extension technique.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A new nucleic acid library of myc-dependent downstream genes capable of supporting a neoplastic characteristic of cancer is useful to find new therapies and diagnoses for cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Myc-dependent downstream gene; neoplastic; cancer; growth; invasion; spread; myc target; myc tag; SAGE; serial analysis of gene expression; myc oncogene; N-myc; human neuroblastoma; cytostatic; ds.

The present invention relates to a nucleic acid library comprising myc-dependent downstream genes or their functional fragments essentially capable of supporting a neoplastic character of cancer such as growth, invasion or spread. These myc target or tag sequences are identified by SAGE (serial analysis of gene expression). The library is useful to find new diagnoses and treatments for cancer. The invention is also useful to enhance production of recombinant proteins in a production system with high expression of endogenous or transfected myc oncogenes. ABK23412-ABK23828 represent transcript tag DNA sequences that are activated or repressed by N-myc in human neuroblastoma.
                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a nucleic acid library comprising myc-dependent downstream genes or their functional fragments essentially capable of supporting a neoplastic character of cancer such as growth, invasion or spread.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to novel single nucleotide polymorphisms (SNPs) in the human adenosine A3 receptor (ADORA3) gene located on chromosome 1p21-p13, and methods for haplotyping and/or genotyping the ADORA3 gene. The methods of the invention make use of allele-specific oligonucleotides (ASOS) as probes and primers and/or primer-extension oligonucleotides for detecting the ADORA3 gene polymorphisms. The polymorphides (ASOS) as probes as cruenced compounds are useful for the treatment of diseases associated with ADORA3 activity, such as pathophysiological conditions of the heart e.g. myocardial ischaemia and chronic heart failure. ABK92629-ABK92654 represent primer-extension oligonucleotides for detecting human ADORA3 gene polymorphisms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             related to

The invention features to a polynuciectude compitising a first nucleotide sequence (NSI) comprising a PLAU (plasminogen activator, urokinase, a serine protease) isogene selected from isogene activator, urokinase, a serine protease) isogene selected from isogenes 1-9 and 11-20 given to the protease isogene comprises the regions of the PLAU gene or DNA and is further defined by the corresponding sequence of polymorphisms (defining single nuclectide polymorphisms, SNP). Also included are methods of haplotyping/genotyping (and predicting the haplotype/genotype of the PLAU gene of an individual, identifying an association between a trait and at least one haplotype or haplotype pair of the PLAU gene, a recombinant non-human organism continued or transfected with the gene or CDNA, fragments of the polymorphism in the PLAU gene, a recombinant non-human organism cransformed or transfected with the gene or CDNA, fragments of the polymucleotides of at least 10 base pairs encompassing a polymorphic variant PLAU protein or fragment, and isolated monoclonal antibody specific for PLAU, a computer system for storing and analysing polymorphism data for the PLAU gene and a genome crangeting PLAU that exe useful for improving the efficiency and cancers. The methods are useful for improving the efficiency and reliability of the discovery and development of drugs for treating cancers. The methods are useful for improving the efficiency and disease associated with PLAU activity, in validating PLAU as a drug cranget and in the design of clinical trials for treating a specific condition of disease associated with PLAU activity, The antibody is useful in diagnostic, prognostic and therapeutic methods. PLAU entition of polynucleotides are useful in studying the expression and function of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a polynucleotide comprising a first nucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Genetic variants of Plasminogen activator, Urokinase (PLAU) isogenes, useful for improving efficiency and reliability in drug development for treating thrombolytic disorders and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are attached to a solid support. The method of the invention be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded DNA molecules, double-stranded DNA molecules and mRNA molecules. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA sequence represents a random amplified polymorphic DNA (RAPD)

```
This sequence represents the recognition site contained within the delta-globin promoter for the delta-EKLF (erythroid Krueppel-like factor) polypeptide (II) of the invention. DNA encoding (II) is used in gene therapy to induce delta-globin gene expression, particularly in haematopoietic cells, specifically for treating sickle cell anaemia and beta-thalassemia. Increased expression of delta-globin increases production of the HbAZ form of haemaglobin which has anti-sickling activity. The DNA encoding (II) is introduced into cells in vivo or in vitro. (II) can also be used to raise specific antibodies, useful for measuring levels of (II) expression in treated patients. Since (II) is transcription factor, lower quantities of it are required compared with
